# Chapter 1

## Hierarchical Index

### 1.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Base . . . . .	7
Optic_Material . . . . .	8
Optic_Materials . . . . .	14
Order . . . . .	17
Orders . . . . .	21
Supplier . . . . .	25
Suppliers . . . . .	30

## Chapter 2

# Class Index

### 2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">Base</a>	A base class providing an interface for serialization and deserialization as well as stream insertion and extraction . . . . .	7
<a href="#">Optic_Material</a>	Class representing an optical material . . . . .	8
<a href="#">Optic_Materials</a>	Class representing a collection of <a href="#">Optic_Material</a> objects . . . . .	14
<a href="#">Order</a>	Class representing an order which includes optic materials and a supplier . . . . .	17
<a href="#">Orders</a>	Class representing a collection of <a href="#">Order</a> objects . . . . .	21
<a href="#">Supplier</a>	Class representing a supplier in the optics materials system . . . . .	25
<a href="#">Suppliers</a>	Class representing a collection of <a href="#">Supplier</a> objects . . . . .	30

## Chapter 3

# File Index

### 3.1 File List

Here is a list of all documented files with brief descriptions:

<a href="#">base.h</a>	35
<a href="#">optic_material.h</a>	35
<a href="#">optic_materials.h</a>	36
<a href="#">order.h</a>	36
<a href="#">orders.h</a>	37
<a href="#">supplier.h</a>	38
<a href="#">suppliers.h</a>	38

## Chapter 4

# Class Documentation

### 4.1 Base Class Reference

A base class providing an interface for serialization and deserialization as well as stream insertion and extraction.

```
#include <base.h>
```

Inheritance diagram for Base:

#### Friends

- ostream & [operator<<](#) (ostream &output, const [Base](#) &base)  
*Overloads the << operator for outputting the [Base](#) object's details to an output stream.*
- istream & [operator>>](#) (istream &input, [Base](#) &base)  
*Overloads the >> operator for reading data into a [Base](#) object from an input stream.*

#### 4.1.1 Detailed Description

A base class providing an interface for serialization and deserialization as well as stream insertion and extraction.

This class defines a common interface for derived classes to implement custom behavior for printing to and reading from streams, and for converting to and from JSON format.

#### 4.1.2 Friends And Related Symbol Documentation

##### 4.1.2.1 operator<<

```
ostream & operator<< (  
    ostream & output,  
    const Base & base ) [friend]
```

Overloads the << operator for outputting the [Base](#) object's details to an output stream.

**Parameters**

<i>output</i>	The output stream to which the data is to be written.
<i>base</i>	The <a href="#">Base</a> object whose data is to be outputted.

**Returns**

Returns the modified output stream for chaining.

**4.1.2.2 operator>>**

```
istream & operator>> (
    istream & input,
    Base & base ) [friend]
```

Overloads the >> operator for reading data into a [Base](#) object from an input stream.

**Parameters**

<i>input</i>	The input stream from which the data is to be read.
<i>base</i>	The <a href="#">Base</a> object where the read data is to be stored.

**Returns**

Returns the modified input stream for chaining.

The documentation for this class was generated from the following file:

- base.h

## 4.2 Optic\_Material Class Reference

Class representing an optical material.

```
#include <optic_material.h>
```

Inheritance diagram for Optic\_Material:

**Public Member Functions**

- **Optic\_Material** ()  
*Default constructor for [Optic\\_Material](#).*
- **Optic\_Material** (string type, double width, double diopter, string name, double price)  
*Constructor for [Optic\\_Material](#) with parameters.*
- string **getType** () const  
*Gets the type of the optical material.*
- void **setType** (string type)  
*Sets the type of the optical material.*
- double **getWidth** () const  
*Gets the width of the optical material.*
- void **setWidth** (double width)  
*Sets the width of the optical material.*
- double **getDiopter** () const  
*Gets the diopter value of the optical material.*
- void **setDiopter** (double diopter)  
*Sets the diopter value of the optical material.*
- string **getName** () const  
*Gets the name of the optical material.*
- void **setName** (string name)  
*Sets the name of the optical material.*
- double **getPrice** () const  
*Gets the price of the optical material.*
- void **setPrice** (double price)  
*Sets the price of the optical material.*
- ostream & **print** (ostream &output) const override  
*Overridden method for printing the optical material's details to an output stream.*
- istream & **input** (istream &input) override  
*Overridden method for reading data into the optical material from an input stream.*
- void **to\_json** (json &j) const override  
*Overridden method for converting the optical material's state to JSON format.*
- void **from\_json** (json &j) override  
*Overridden method for setting the optical material's state from JSON format.*

**4.2.1 Detailed Description**

Class representing an optical material.

This class stores details of an optical material and provides methods for setting and getting its properties. It extends the [Base](#) class, providing implementations for serialization and deserialization to/from streams and JSON.

**4.2.2 Constructor & Destructor Documentation****4.2.2.1 Optic\_Material()**

```
Optic_Material::Optic_Material (
    string type,
    double width,
    double diopter,
    string name,
    double price )
```

Constructor for [Optic\\_Material](#) with parameters.

**Parameters**

<i>type</i>	The type of the optical material.
<i>width</i>	The width of the optical material.
<i>dioptr</i>	The dioptr value of the optical material.
<i>name</i>	The name of the optical material.
<i>price</i>	The price of the optical material.

## 4.2.3 Member Function Documentation

### 4.2.3.1 from\_json()

```
void Optic_Material::from_json (
    json & j ) [override], [virtual]
```

Overridden method for setting the optical material's state from JSON format.

**Parameters**

<i>j</i>	JSON object from which the object's state is to be read.
----------	--

Implements [Base](#).

### 4.2.3.2 getDioptr()

```
double Optic_Material::getDioptr ( ) const
```

Gets the dioptr value of the optical material.

**Returns**

The dioptr value of the optical material.

### 4.2.3.3 getName()

```
std::string Optic_Material::getName ( ) const
```

Gets the name of the optical material.

**Returns**

The name of the optical material.

#### 4.2.3.4 getPrice()

```
double Optic_Material::getPrice ( ) const
```

Gets the price of the optical material.

##### Returns

The price of the optical material.

#### 4.2.3.5 getType()

```
std::string Optic_Material::getType ( ) const
```

Gets the type of the optical material.

##### Returns

The type of the optical material.

#### 4.2.3.6 getWidth()

```
double Optic_Material::getWidth ( ) const
```

Gets the width of the optical material.

##### Returns

The width of the optical material.

#### 4.2.3.7 input()

```
istream & Optic_Material::input (
    istream & input ) [override], [virtual]
```

Overridden method for reading data into the optical material from an input stream.

##### Parameters

<i>input</i>	The input stream from which the data is to be read.
--------------	---

##### Returns

Reference to the modified input stream.

Implements [Base](#).

#### 4.2.3.8 print()

```
ostream & Optic_Material::print (
    ostream & output ) const [override], [virtual]
```

Overridden method for printing the optical material's details to an output stream.

##### Parameters

<i>output</i>	The output stream to which the data is to be written.
---------------	---

##### Returns

Reference to the modified output stream.

Implements [Base](#).

#### 4.2.3.9 setDiopter()

```
void Optic_Material::setDiopter (
    double diopter )
```

Sets the diopter value of the optical material.

##### Parameters

<i>diopter</i>	The diopter value of the optical material.
----------------	--

#### 4.2.3.10 setName()

```
void Optic_Material::setName (
    string name )
```

Sets the name of the optical material.

##### Parameters

<i>name</i>	The name of the optical material.
-------------	-----------------------------------

#### 4.2.3.11 setPrice()

```
void Optic_Material::setPrice (
    double price )
```

Sets the price of the optical material.

## Parameters

<i>price</i>	The price of the optical material.
--------------	------------------------------------

**4.2.3.12 setType()**

```
void Optic_Material::setType (
    string type )
```

Sets the type of the optical material.

## Parameters

<i>type</i>	The type of the optical material.
-------------	-----------------------------------

**4.2.3.13 setWidth()**

```
void Optic_Material::setWidth (
    double width )
```

Sets the width of the optical material.

## Parameters

<i>width</i>	The width of the optical material.
--------------	------------------------------------

**4.2.3.14 toJson()**

```
void Optic_Material::toJson (
    json & j ) const [override], [virtual]
```

Overridden method for converting the optical material's state to JSON format.

## Parameters

<i>j</i>	JSON object to which the object's state is to be written.
----------	---

Implements [Base](#).

The documentation for this class was generated from the following files:

- optic\_material.h
- optic\_material.cpp

## 4.3 Optic\_Materials Class Reference

Class representing a collection of [Optic\\_Material](#) objects.

```
#include <optic_materials.h>
```

Inheritance diagram for Optic\_Materials:

### Public Member Functions

- **Optic\_Materials** ()=default  
*Default constructor for [Optic\\_Materials](#).*
- int [getSize](#) () const  
*Gets the number of optic materials in the collection.*
- void [addOpticMaterial](#) (const [Optic\\_Material](#) &optic\_material)  
*Adds an [Optic\\_Material](#) object to the collection.*
- vector< [Optic\\_Material](#) > [getOpticMaterials](#) ()  
*Retrieves all optic materials in the collection.*
- [Optic\\_Material](#) [getOpticMaterialByIndex](#) (int index) const  
*Retrieves an [Optic\\_Material](#) object at a specified index in the collection.*
- ostream & [print](#) (ostream &output) const override  
*Overridden method for printing the collection's details to an output stream.*
- void [print\\_on\\_one\\_line](#) () const  
*Prints a concise one-line description of each optic material in the collection.*
- istream & [input](#) (istream &input) override  
*Overridden method for reading data into the collection from an input stream.*
- void [to\\_json](#) (json &j) const override  
*Overridden method for converting the collection's state to JSON format.*
- void [from\\_json](#) (json &j) override  
*Overridden method for setting the collection's state from JSON format.*

### 4.3.1 Detailed Description

Class representing a collection of [Optic\\_Material](#) objects.

This class encapsulates a collection of [Optic\\_Material](#) objects and provides methods for managing this collection, including adding and retrieving optic materials, and implementing serialization and deserialization to/from streams and JSON.

### 4.3.2 Member Function Documentation

#### 4.3.2.1 addOpticMaterial()

```
void Optic_Materials::addOpticMaterial (
    const Optic\_Material & optic_material )
```

Adds an [Optic\\_Material](#) object to the collection.

## Parameters

<i>optic_material</i>	The <a href="#">Optic_Material</a> object to be added.
-----------------------	--

**4.3.2.2 from\_json()**

```
void Optic_Materials::from_json (
    json & j ) [override], [virtual]
```

Overridden method for setting the collection's state from JSON format.

## Parameters

<i>j</i>	JSON object from which the collection's state is to be read.
----------	--

Implements [Base](#).

**4.3.2.3 getOpticMaterialByIndex()**

```
Optic\_Material Optic_Materials::getOpticMaterialByIndex (
    int index ) const
```

Retrieves an [Optic\\_Material](#) object at a specified index in the collection.

## Parameters

<i>index</i>	The index of the <a href="#">Optic_Material</a> object to retrieve.
--------------	---

## Returns

The [Optic\\_Material](#) object at the specified index.

**4.3.2.4 getOpticMaterials()**

```
vector< Optic\_Material > Optic_Materials::getOpticMaterials ( )
```

Retrieves all optic materials in the collection.

## Returns

A vector containing all [Optic\\_Material](#) objects in the collection.

**4.3.2.5 getSize()**

```
int Optic_Materials::getSize ( ) const
```

Gets the number of optic materials in the collection.

## Returns

The size of the optic materials collection.

#### 4.3.2.6 input()

```
istream & Optic_Materials::input (
    istream & input ) [override], [virtual]
```

Overridden method for reading data into the collection from an input stream.

##### Parameters

<i>input</i>	The input stream from which the data is to be read.
--------------	---

##### Returns

Reference to the modified input stream.

Implements [Base](#).

#### 4.3.2.7 print()

```
ostream & Optic_Materials::print (
    ostream & output ) const [override], [virtual]
```

Overridden method for printing the collection's details to an output stream.

##### Parameters

<i>output</i>	The output stream to which the collection's data is to be written.
---------------	--

##### Returns

Reference to the modified output stream.

Implements [Base](#).

#### 4.3.2.8 to\_json()

```
void Optic_Materials::to_json (
    json & j ) const [override], [virtual]
```

Overridden method for converting the collection's state to JSON format.

##### Parameters

<i>j</i>	JSON object to which the collection's state is to be written.
----------	---

Implements [Base](#).

The documentation for this class was generated from the following files:

- optic\_materials.h
- optic\_materials.cpp

## 4.4 Order Class Reference

Class representing an order which includes optic materials and a supplier.

```
#include <order.h>
```

Inheritance diagram for Order:

### Public Member Functions

- **Order** ()  
*Default constructor for [Order](#).*
- **Order** (int id, vector< [Optic\\_Material](#) > materials, [Supplier](#) supplier)  
*Constructor for [Order](#) with parameters.*
- void **setId** (int id)  
*Sets the unique identifier of the order.*
- int **getId** ()  
*Gets the unique identifier of the order.*
- vector< [Optic\\_Material](#) > **getMaterials** ()  
*Retrieves all optic materials included in the order.*
- void **addMaterial** (const [Optic\\_Material](#) &material)  
*Adds an optic material to the order.*
- void **addSupplier** (const [Supplier](#) &supplier)  
*Sets the supplier for the order.*
- [Supplier](#) **getSupplier** ()  
*Gets the supplier associated with the order.*
- double **getTotalRaw** ()  
*Calculates the total cost of the order without profit margin.*
- double **getTotal** ()  
*Calculates the total cost of the order including the supplier's profit margin.*
- ostream & **print** (ostream &output) const override  
*Overridden method for printing the order's details to an output stream.*
- istream & **input** (istream &input) override  
*Overridden method for reading data into the order from an input stream.*
- void **to\_json** (json &j) const override  
*Overridden method for converting the order's state to JSON format.*
- void **from\_json** (json &j) override  
*Overridden method for setting the order's state from JSON format.*

### 4.4.1 Detailed Description

Class representing an order which includes optic materials and a supplier.

This class encapsulates the details of an order, including a list of optic materials, a supplier, and methods for managing and calculating the total cost of the order. It extends the [Base](#) class, providing implementations for serialization and deserialization to/from streams and JSON.

### 4.4.2 Constructor & Destructor Documentation

#### 4.4.2.1 Order()

```
Order::Order (
    int id,
    vector< Optic\_Material > materials,
    Supplier supplier )
```

Constructor for [Order](#) with parameters.

##### Parameters

<i>id</i>	The unique identifier for the order.
<i>materials</i>	A vector of <a href="#">Optic_Material</a> objects included in the order.
<i>supplier</i>	The <a href="#">Supplier</a> associated with the order.

### 4.4.3 Member Function Documentation

#### 4.4.3.1 addMaterial()

```
void Order::addMaterial (
    const Optic\_Material & material )
```

Adds an optic material to the order.

##### Parameters

<i>material</i>	The <a href="#">Optic_Material</a> object to be added to the order.
-----------------	---

#### 4.4.3.2 addSupplier()

```
void Order::addSupplier (
    const Supplier & supplier )
```

Sets the supplier for the order.

**Parameters**

<i>supplier</i>	The <a href="#">Supplier</a> to be associated with the order.
-----------------	---

**4.4.3.3 from\_json()**

```
void Order::from_json (
    json & j ) [override], [virtual]
```

Overridden method for setting the order's state from JSON format.

**Parameters**

<i>j</i>	JSON object from which the order's state is to be read.
----------	---

Implements [Base](#).

**4.4.3.4 getId()**

```
int Order::getId ( )
```

Gets the unique identifier of the order.

**Returns**

The unique identifier of the order.

**4.4.3.5 getMaterials()**

```
vector< Optic\_Material > Order::getMaterials ( )
```

Retrieves all optic materials included in the order.

**Returns**

A vector of [Optic\\_Material](#) objects in the order.

**4.4.3.6 getSupplier()**

```
Supplier Order::getSupplier ( )
```

Gets the supplier associated with the order.

**Returns**

The [Supplier](#) associated with the order.

#### 4.4.3.7 getTotal()

```
double Order::getTotal ( )
```

Calculates the total cost of the order including the supplier's profit margin.

##### Returns

The total cost of the order.

#### 4.4.3.8 getTotalRaw()

```
double Order::getTotalRaw ( )
```

Calculates the total cost of the order without profit margin.

##### Returns

The total raw cost of the order.

#### 4.4.3.9 input()

```
istream & Order::input (
    istream & input ) [override], [virtual]
```

Overridden method for reading data into the order from an input stream.

##### Parameters

<i>input</i>	The input stream from which the order data is to be read.
--------------	---

##### Returns

Reference to the modified input stream.

Implements [Base](#).

#### 4.4.3.10 print()

```
ostream & Order::print (
    ostream & output ) const [override], [virtual]
```

Overridden method for printing the order's details to an output stream.

##### Parameters

<i>output</i>	The output stream to which the order's data is to be written.
---------------	---

**Returns**

Reference to the modified output stream.

Implements [Base](#).

**4.4.3.11 setId()**

```
void Order::setId (
    int id )
```

Sets the unique identifier of the order.

**Parameters**

<i>id</i>	The unique identifier for the order.
-----------	--------------------------------------

**4.4.3.12 toJson()**

```
void Order::toJson (
    json & j ) const [override], [virtual]
```

Overridden method for converting the order's state to JSON format.

**Parameters**

<i>j</i>	JSON object to which the order's state is to be written.
----------	--

Implements [Base](#).

The documentation for this class was generated from the following files:

- order.h
- order.cpp

## 4.5 Orders Class Reference

Class representing a collection of [Order](#) objects.

```
#include <orders.h>
```

Inheritance diagram for Orders:

## Public Member Functions

- **Orders ()**  
*Default constructor for [Orders](#).*
- void [addOrder](#) (const [Order](#) &order)  
*Adds an [Order](#) object to the collection.*
- vector< [Order](#) > [getOrders](#) ()  
*Retrieves all orders in the collection.*
- void [addMaterialToLastOrder](#) (const [Optic\\_Material](#) &material)  
*Adds an optic material to the last order in the collection.*
- void [addSupplierToLastOrder](#) (const [Supplier](#) &supplier)  
*Adds a supplier to the last order in the collection.*
- void [addIdToLastOrder](#) (int id)  
*Sets the ID for the last order in the collection.*
- void **printOrderTotal** ()  
*Prints the total cost of each order in the collection.*
- ostream & [print](#) (ostream &output) const override  
*Overridden method for printing the collection's details to an output stream.*
- istream & [input](#) (istream &input) override  
*Overridden method for reading data into the collection from an input stream.*
- void [to\\_json](#) (json &j) const override  
*Overridden method for converting the collection's state to JSON format.*
- void [from\\_json](#) (json &j) override

### 4.5.1 Detailed Description

Class representing a collection of [Order](#) objects.

This class manages a collection of [Order](#) objects and provides methods for adding orders and managing their contents. It extends the [Base](#) class, implementing serialization and deserialization to/from streams and JSON.

### 4.5.2 Member Function Documentation

#### 4.5.2.1 addIdToLastOrder()

```
void Orders::addIdToLastOrder (
    int id )
```

Sets the ID for the last order in the collection.

#### Parameters

<i>id</i>	The unique identifier for the last order.
-----------	---

#### 4.5.2.2 addMaterialToLastOrder()

```
void Orders::addMaterialToLastOrder (
```

```
const Optic_Material & material )
```

Adds an optic material to the last order in the collection.

#### Parameters

<i>material</i>	The <a href="#">Optic_Material</a> object to be added to the last order.
-----------------	--

### 4.5.2.3 addOrder()

```
void Orders::addOrder (
    const Order & order )
```

Adds an [Order](#) object to the collection.

#### Parameters

<i>order</i>	The <a href="#">Order</a> object to be added.
--------------	---

### 4.5.2.4 addSupplierToLastOrder()

```
void Orders::addSupplierToLastOrder (
    const Supplier & supplier )
```

Adds a supplier to the last order in the collection.

#### Parameters

<i>supplier</i>	The <a href="#">Supplier</a> to be associated with the last order.
-----------------	--

### 4.5.2.5 from\_json()

```
void Orders::from_json (
    json & j ) [override], [virtual]
```

Overridden method for setting the collection's state from JSON format.

#### Parameters

<i>j</i>	JSON object from which the collection's state is to be read.
----------	--

Implements [Base](#).

### 4.5.2.6 getOrders()

```
vector< Order > Orders::getOrders ( )
```

Retrieves all orders in the collection.

**Returns**

A vector containing all [Order](#) objects in the collection.

**4.5.2.7 input()**

```
istream & Orders::input (
    istream & input ) [override], [virtual]
```

Overridden method for reading data into the collection from an input stream.

**Parameters**

<i>input</i>	The input stream from which the data is to be read.
--------------	---

**Returns**

Reference to the modified input stream.

Implements [Base](#).

**4.5.2.8 print()**

```
ostream & Orders::print (
    ostream & output ) const [override], [virtual]
```

Overridden method for printing the collection's details to an output stream.

**Parameters**

<i>output</i>	The output stream to which the collection's data is to be written.
---------------	--

**Returns**

Reference to the modified output stream.

Implements [Base](#).

**4.5.2.9 to\_json()**

```
void Orders::to_json (
    json & j ) const [override], [virtual]
```

Overridden method for converting the collection's state to JSON format.

**Parameters**

<i>j</i>	JSON object to which the collection's state is to be written.
----------	---

Implements [Base](#).

The documentation for this class was generated from the following files:

- orders.h
- orders.cpp

## 4.6 Supplier Class Reference

Class representing a supplier in the optics materials system.

```
#include <supplier.h>
```

- void **from\_json** (json &j) override  
*Overridden method for setting the supplier's state from JSON format.*

### 4.6.1 Detailed Description

Class representing a supplier in the optics materials system.

This class stores details about a supplier, including identification, contact information, and profit margin. It extends the [Base](#) class, providing implementations for serialization and deserialization to/from streams and JSON.

### 4.6.2 Constructor & Destructor Documentation

#### 4.6.2.1 Supplier()

```
Supplier::Supplier (
    std::string bulstat,
    std::string name,
    std::string location,
    std::string phone,
    double profit_margin )
```

Constructor for [Supplier](#) with parameters.

##### Parameters

<i>bulstat</i>	The unique identifier for the supplier.
<i>name</i>	The name of the supplier.
<i>location</i>	The location of the supplier.
<i>phone</i>	The contact phone number of the supplier.
<i>profit_margin</i>	The profit margin of the supplier.

### 4.6.3 Member Function Documentation

#### 4.6.3.1 from\_json()

```
void Supplier::from_json (
    json & j ) [override], [virtual]
```

Overridden method for setting the supplier's state from JSON format.

##### Parameters

<i>j</i>	JSON object from which the supplier's state is to be read.
----------	--

Implements [Base](#).

#### 4.6.3.2 getBulstat()

```
std::string Supplier::getBulstat ( ) const
```

Gets the unique identifier of the supplier.

**Returns**

The bulstat of the supplier.

**4.6.3.3 getLocation()**

```
std::string Supplier::getLocation ( ) const
```

Gets the location of the supplier.

**Returns**

The location of the supplier.

**4.6.3.4 getName()**

```
std::string Supplier::getName ( ) const
```

Gets the name of the supplier.

**Returns**

The name of the supplier.

**4.6.3.5 getPhone()**

```
std::string Supplier::getPhone ( ) const
```

Gets the contact phone number of the supplier.

**Returns**

The phone number of the supplier.

**4.6.3.6 getProfitMargin()**

```
double Supplier::getProfitMargin ( ) const
```

Gets the profit margin of the supplier.

**Returns**

The profit margin of the supplier.

**4.6.3.7 input()**

```
istream & Supplier::input (
    istream & input ) [override], [virtual]
```

Overridden method for reading data into the supplier from an input stream.

**Parameters**

<i>input</i>	The input stream from which the supplier data is to be read.
--------------	--

**Returns**

Reference to the modified input stream.

Implements [Base](#).

**4.6.3.8 print()**

```
ostream & Supplier::print (
    ostream & output ) const [override], [virtual]
```

Overridden method for printing the supplier's details to an output stream.

**Parameters**

<i>output</i>	The output stream to which the supplier's data is to be written.
---------------	--

**Returns**

Reference to the modified output stream.

Implements [Base](#).

**4.6.3.9 setBulstat()**

```
void Supplier::setBulstat (
    std::string bulstat )
```

Sets the unique identifier of the supplier.

**Parameters**

<i>bulstat</i>	The bulstat to set for the supplier.
----------------	--------------------------------------

**4.6.3.10 setLocation()**

```
void Supplier::setLocation (
    std::string location )
```

Sets the location of the supplier.

## Parameters

<i>location</i>	The location to set for the supplier.
-----------------	---------------------------------------

**4.6.3.11 setName()**

```
void Supplier::setName (  
    std::string name )
```

Sets the name of the supplier.

## Parameters

<i>name</i>	The name to set for the supplier.
-------------	-----------------------------------

**4.6.3.12 setPhone()**

```
void Supplier::setPhone (  
    std::string phone )
```

Sets the contact phone number of the supplier.

## Parameters

<i>phone</i>	The phone number to set for the supplier.
--------------	---

**4.6.3.13 setProfitMargin()**

```
void Supplier::setProfitMargin (  
    double profit_margin )
```

Sets the profit margin for the supplier.

## Parameters

<i>profit_margin</i>	The profit margin to set for the supplier.
----------------------	--

**4.6.3.14 to\_json()**

```
void Supplier::to_json (  
    nlohmann::json & j ) const [override], [virtual]
```

Overridden method for converting the supplier's state to JSON format.

## Parameters

<i>j</i>	JSON object to which the supplier's state is to be written.
----------	---

Implements [Base](#).

The documentation for this class was generated from the following files:

- `supplier.h`
- `supplier.cpp`

## 4.7 Suppliers Class Reference

### 4.7.1 Detailed Description

Class representing a collection of [Supplier](#) objects.

This class manages a collection of [Supplier](#) objects and provides methods for adding suppliers and accessing them. It extends the [Base](#) class, implementing serialization and deserialization to/from streams and JSON.

### 4.7.2 Member Function Documentation

#### 4.7.2.1 addSupplier()

```
void Suppliers::addSupplier (
    const Supplier & supplier )
```

Adds a [Supplier](#) object to the collection.

##### Parameters

<i>supplier</i>	The <a href="#">Supplier</a> object to be added.
-----------------	--

#### 4.7.2.2 from\_json()

```
void Suppliers::from_json (
    json & j ) [override], [virtual]
```

Overridden method for setting the collection's state from JSON format.

##### Parameters

<i>j</i>	JSON object from which the collection's state is to be read.
----------	--

Implements [Base](#).

#### 4.7.2.3 getSize()

```
int Suppliers::getSize ( ) const
```

Gets the number of suppliers in the collection.

##### Returns

The size of the suppliers collection.

#### 4.7.2.4 getSupplierByIndex()

```
Supplier Suppliers::getSupplierByIndex (
    int index ) const
```

Retrieves a [Supplier](#) object at a specified index in the collection.

**Parameters**

<i>index</i>	The index of the <a href="#">Supplier</a> object to retrieve.
--------------	---

**Returns**

The [Supplier](#) object at the specified index.

**4.7.2.5 getSuppliers()**

```
vector< Supplier > Suppliers::getSuppliers ( )
```

Retrieves all suppliers in the collection.

**Returns**

A vector containing all [Supplier](#) objects in the collection.

**4.7.2.6 input()**

```
istream & Suppliers::input (
    istream & input ) [override], [virtual]
```

Overridden method for reading data into the collection from an input stream.

**Parameters**

<i>input</i>	The input stream from which the data is to be read.
--------------	---

**Returns**

Reference to the modified input stream.

Implements [Base](#).

**4.7.2.7 print()**

```
ostream & Suppliers::print (
    ostream & output ) const [override], [virtual]
```

Overridden method for printing the collection's details to an output stream.

**Parameters**

<i>output</i>	The output stream to which the collection's data is to be written.
---------------	--

**Returns**

Reference to the modified output stream.

Implements [Base](#).

**4.7.2.8 to\_json()**

```
void Suppliers::to_json (
    json & j ) const [override], [virtual]
```

Overridden method for converting the collection's state to JSON format.

**Parameters**

<i>j</i>	JSON object to which the collection's state is to be written.
----------	---

Implements [Base](#).

The documentation for this class was generated from the following files:
